➤ **MOOC Courses:**

- ✓ The MOOC Course must be from NPTEL of minimum 12 weeks duration.
- ✓ Generally the selected course should be in line with specializations or project needs.

(MTS-25001) Applied Numerical Methods with C ++

Teaching Scheme

Examination Scheme

Lectures: 3 hrs/week, Tutorial:1hr/week MSE -30, TA – 20, End-Sem Exam - 50

Course Outcomes:

At the end of the course, students will demonstrate the ability to:

1. remember basics of numerical methods.
2. understand basic concepts of numerical differentiation and integration and interpolation.
3. find numerical solutions to ordinary differential equations PDEs, algebraic and transcendental equations.
4. compare numerical solutions obtained by analytical methods with solutions obtained by C++ and MATLAB programs.
5. write C++ and MATLAB program and run it in the laboratory for the given data.

Syllabus Contents:

Prerequisites: Concepts of programming: Revision of Coding languages such as C++ , Introduction to Mathematical Modeling

Unit I : Finding roots of equations: Numerical Solution of Algebraic and Transcendental equations: Bisection Method, Secant Method, Regula-Falsi Method, Newton-Raphson Method, Successive Approximation Method, Applications. [4L+2T]

Unit II: Interpolation and Extrapolation: Lagrange's Interpolation, Newton's forward, backward and central difference method, divided difference method, Inverse Interpolation, Curve Fitting: least square criteria- 1st and 2nd Degree, Applications. [5L+2T]

Unit III: Numerical Differentiation, Integration:
Numerical Differentiation: Forward, Backward and Central Difference Methods, Applications.
Numerical integration: Trapezoidal Rule, Simpson 1/3rd and 3/8th Rule, Weddle's Rule, Gauss Quadrature - Two and Three Point Formula, Double Integration, Applications.
[7L+4T]

Unit IV: Numerical Solution of linear equations: Solution of linear simultaneous equations: Homogeneous/Non-homogeneous systems, Gauss Elimination, Gauss Jordan, Gauss-Seidel Methods, LU- Decomposition, Cholesky Method, Applications. [4L+4T]

Unit V: Numerical Solution of ODEs and PDEs

Numerical Solution of Ordinary Differential Equation: Taylor Series Method, Euler Method, Modified Euler Method, Runge Kutta 2nd and 4th order method, Simultaneous Differential Equations and Second Order Differential Equations, Applications, predictor-corrector methods and Boundary value

problems, Linear PDEs by finite differences,
Project: Programming projects based on mathematical modeling and application of appropriate numerical methods [8L+6T]

Text Books:

- Numerical Methods for Engineers; Steven C. Chapra and Raymond P. Canale, 7th edition, McGraw-Hill, 2014.
- Introduction to Numerical Analysis, S.S. Sastry; Prentice Hall of India, 2012.
- Numerical Methods for Engineers, Santhosh .K. Gupta, New Age International; 2012.
- Applied Numerical Methods for Digital Computation , M.L. James, G.M. Smith & J.C. Wolford, Harper- Collins College Division; 4th edition, 1993.

Reference Books:

- Balagurusamy, E., Numerical Methods, Tata McGraw Hill Publication.
- Rajaraman, V., Computer Oriented Numerical Methods, Prentice Hall of India Ltd.
- Sastry, S. S., Introductory Methods of Numerical Analysis, Prentice Hall of India Ltd.
- Jain, M.K., Iyengar, S.R.K. and Jain, R.K., Numerical Methods for Scientific and Engineering Computations, 5th Ed., New Age International Ltd.
- Rajasekaran, S., Numerical Methods in Science and Engineering – A practical Approach, S. Chand and Co. Ltd.
- Rao, S.S., Optimization Theory and Applications, New Age International Ltd.

Note :

- To measure CO1, questions may be of the type- define, identify, state, match, list, name etc.
- To measure CO2, questions may be of the type- explain, describe, illustrate, evaluate, give examples, compute etc.
- To measure CO3, questions will be based on applications of core concepts.
- To measure CO4, questions may be of the type- true/false with justification, theoretical fill in the blanks, theoretical problems, prove implications or corollaries of theorems, etc.
- To measure CO5, some questions may be based on self-study topics and also comprehension of unseen passages.

(MTS-25002) Fluid Dynamics

Teaching Scheme :

Lectures: 3 hrs/week

Examination Scheme:

MSE-30, TA-20, ESE-50

Course Outcomes:

At the end of the course the Students shall be able

1. Understand and define the fluid flow problems along with range of governing parameters
2. Take up the fluid flow problems of industrial base.
3. Devise the experiments in the field of fluid mechanics.
4. Understand the flow patterns and differentiate between the flow regimes and its effects.

Syllabus Contents:

- **Governing equations in Fluid Dynamics:** Derivation of Continuity and Momentum equations using integral and differential approach, dimensionless form of governing equations, special forms of governing equations, integral quantities
- **Exact Solutions of Navier-Stokes Equations:** Fully developed flows, parallel flow in straight channel, Couette flow, Creeping flows
- **Potential Flow:** Kelvin's theorem, Irrotational flow, Stream function-vorticity approach,
- **Laminar Boundary layers:** Boundary layer equations, flow over flat plate, Momentum integral equation for boundary layer, approximate solution methodology for boundary layer equations
- **Turbulent Flow:** Characteristics of turbulent flow, laminar turbulent transition, time mean motion and fluctuations, derivation of governing equations for turbulent flow, shear stress models, universal velocity distribution
- **Experimental Techniques:** Role of experiments in fluid, layout of fluid flow experiments, sources of error in experiments, data analysis, design of experiments, review of probes and transducers, Introduction to Hot wire Anemometry, Laser Doppler Velocimetry and Particle Image Velocimetry

Any four practical / simulation based assignments from the below list for Thermal Engineering Lab Practice course component:

- 1) Write code for verifying Navier-Stoke equations in a cartesian, cylindrical coordinate systems for fluid flow
- 2) Write the code for exact solution of Fully Developed Laminar Flow in a Straight Channel/Pipe
- 3) Write the code for Irrotational and Potential Flow around immersed bodies
- 4) Write the code for boundary layer thickness, displacement thickness, momentum thickness using different relations compare with Blasius equation.
- 5) Write the code for the turbulent Navier-StokeEquations in a Cartesian coordinate systems for fluid flow
- 6) Measuring Flow Rate and Pressure Drop Using Classical Instruments.

Teaching Scheme

Lectures: 3 hrs/week

Tutorial : 1 hr/week

(MTS-25003)

Advanced Thermodynamics

Examination Scheme,

MSE -30, TA – 20, End-Sem Exam – 50

Course Outcomes:

At the end of the course, the students will be able to:

1. Apply the 1st Law for steady and transient systems.
2. Apply the 2nd Law for cyclic systems
3. Analyze multi-components systems.
4. Analyze exergy, availability, and irreversibility in closed and open thermodynamic systems
5. Apply mass, energy, entropy, and availability balance equations for closed and open thermodynamic systems
6. Derive and apply thermodynamic relations between the measurable and non-measurable properties.
7. Determine adiabatic flame temperature
8. Appreciate importance of non-equilibrium thermodynamics

Syllabus Contents:

- **Recapitulation of Fundamentals, Maxwell equations**
Laws of Thermodynamics, First Law Analysis of Closed Systems and Open Systems, Thermodynamic behavior of real gases.
- **Second Law Analysis of Thermodynamic Systems**
Introduction, Thermodynamic availability, Second Law Analysis of Closed Systems and Open Systems
- **Thermodynamic relationships.**
Mathematical preliminaries, Gibbs equations and Maxwell Relations, General Equations for internal energy, enthalpy, entropy and specific heats, other thermodynamic relations
- **Thermodynamics of Chemical reactions**
Introduction, conservation of mass, theoretical combustion process, actual combustion process, enthalpy of formation, enthalpy of combustion and heating values, adiabatic flame temperature.
- **Elements of equilibrium and non-equilibrium thermodynamics**

MTS-25004 Advanced Heat Transfer

Teaching Scheme

Lectures: 3 hrs/week

Examination Scheme

MSE -30, TA – 20, End-Sem Exam - 50

Course Outcomes:

At the end of the course the students will be able to

1. Understand the fundamental governing equations of conduction, convection and radiation
2. Account for the consequence of heat transfer in thermal analyses of engineering systems
3. Evaluate heat transfer coefficients in forced convection for internal and external flows.
4. Calculate radiation heat transfer between black body surfaces and gray body surfaces.

Syllabus Contents:

- Steady and transient conduction- one and two dimensional
- Fins, conduction with heat source, unsteady state heat transfer
- Natural and forced convection, integral equation, analysis and analogies,
- Transpiration cooling, ablation heat transfer, boiling, condensation and two phase flow mass transfer, cooling, fluidized bed combustion,
- Heat pipes, Radiation, shape factor, analogy, shields,
- Radiation of gases & vapours.

Any four practical / simulation based assignments from the below list for Thermal Engineering Lab Practice course component:

1. Performance evaluation of Heat pipes by performing trial or using suitable simulation technique
2. Performance evaluation of plate type heat exchangers by performing trial or using suitable simulation technique
3. Performance evaluation for micro channel heat exchangers by performing trial or using suitable simulation technique
4. Case study/Simulation of PCM based thermal storage device
5. Numerical solution of 2D heat conduction problem

(MTS-25005) Low Temperature Energy System

Teaching Scheme: Lectures: 2hrs/week, Practical:2hr/week
Examination Scheme Theory: MSE -30, TA – 20 marks , ESE – 50
Lab : MSE-50 , ESE-50

Course Outcomes:

At the end of the course, students will be able to:

1. Understand basics of refrigeration and cryogenics and its application areas
2. Design the refrigeration systems for domestic and industrial applications like cold storages
3. Demonstrate knowledge about ODP, GWP and related environmental issues

Syllabus Contents:

- Vapour compression refrigeration, actual cycle, second law efficiency,
- Multistage compression with inter-cooling, Multi-evaporator systems, Cascade systems,
- Performance characteristics and capacity control of reciprocating and centrifugal compressors, screw compressor and scroll compressor,
- Design, selection of evaporators, condensers, control systems, motor selection,
- Refrigerants, alternative refrigerants, CFC/HCFC phase-out regulations,
- Refrigeration applications, food preservation, transport,
- Introduction to Vapor absorption refrigeration, single effect and double effect systems,
- Gas liquefaction systems - Linde-Hampson, Linde dual pressure, Claude cycle.

Any four practical / simulation based assignments from the below list for practical component of Low temperature system course:

1. Performance evaluation of vapour compression refrigeration system by performing trial or using suitable simulation technique
2. Performance evaluation of vapour absorption refrigeration system by performing trial or using suitable simulation technique
3. Performance evaluation of vapour compression refrigeration system by performing trial or using suitable simulation technique
4. Analysis of Linde-Hampson and Claude cycle by using computer coding
5. Study of performance characteristics and capacity control of compressors using virtual lab

(MTS-25006) Thermal Engineering Lab Practice

Teaching Scheme: Practical: 4hr/week

Examination Scheme Lab : MSE-50 , ESE-50

Course Outcomes:

At the end of the course, students will be able to:

1. Apply the fundamental understanding of Fluid Dynamics concepts to the practical problems
2. Prepare computer code for boundary layer problems
3. Evaluate the performance of heat pipes
4. Carry out the performance evaluation of heat transfer systems

Syllabus Contents:

- Students are expected to carry out at least 8 practical/simulation based assignments
1. Write code for verifying Navier-Stoke equations in a cartesian, cylindrical coordinate systems for fluid flow
 2. Write the code for exact solution of Fully Developed Laminar Flow in a Straight Channel/Pipe
 3. Write the code for Irrotational and Potential Flow around immersed bodies
 4. Write the code for boundary layer thickness, displacement thickness, momentum thickness using different relations compare with Blasius equation
 5. Write the code for the turbulent Navier-Stoke equations in a cartesian coordinate systems for fluid flow
 6. Measuring Flow Rate and Pressure Drop Using Classical Instruments
 7. Performance evaluation of Heat pipes by performing trial or using suitable simulation technique
 8. Performance evaluation of plate type heat exchangers by performing trial or using suitable simulation technique
 9. Performance evaluation for micro channel heat exchangers by performing trial or using suitable simulation technique
 10. Simulation of PCM based thermal storage device
 11. Numerical solution of 2D heat conduction problem

(Minimum four from each course of Advanced Heat Transfer and Fluid Dynamics as detailed in the syllabus of respective courses)

Electric System: Demand control, Demand Side Management (DSM), Power Factor Improvement, benefits and ways of improvement, Load scheduling, Electric motors, losses, efficiency, energy-efficient motors, motor speed control, variable speed drive. Lighting: Illumination levels, fixtures, timers, energy- efficient illumination.

MTS(PE)-25002 Design of Thermal Systems**Examination Scheme:**

MSE -30, TA – 20 marks, End-Sem Exam - 50

Course Outcomes:

At the end of the course the students will be able to

1. Understand the basic principles of thermal design
2. Apply the basic modeling knowledge about subjects of applied thermodynamics and heat transfer to the devices such as heat exchangers, evaporators, condensers, boilers, condensation of binary mixtures and turbo machinery
3. Construct the simulation of thermal systems
4. Understand the basic of optimum system design

Syllabus Contents:

1. Fundamentals of engineering design. Economic analysis. Equation fitting. Solution of linear and nonlinear equation sets. Cost analysis.
2. Fundamentals of design, and selection of thermal equipment and processes such as heat exchangers, evaporators, condensers, boilers, binary mixtures and turbo machinery.
3. Mathematical modeling of thermal equipment.
4. Simulation of thermal systems.
5. Fundamentals of optimum system design. Optimization methods and optimization of thermal systems.

References:

1. Stoker W. F., Design of Thermal Systems, McGraw Hill

MTS(PE)-25003 IC Engine Combustion and pollution

Examination Scheme: MSE -30, TA – 20 marks , End-Sem Exam - 50

Course Outcomes:

At the end of the course the students will be able to

1. Understand the thermo-chemistry of Fuel-air mixtures, Thermodynamic analysis of IC engines and models used in IC engines.
2. Understand gas exchange process, combustion in SI engines.
3. Understand the combustion in diesel engines
4. Identify the nature and extent of the problem of pollutant formation and control and modern developments in IC engines.

Syllabus Contents:

Thermochemistry of Fuel-air mixtures, Properties of working fluids, chemical kinetics, First law analysis, Availability analysis of engine processes. Conceptual SI engine combustion models, features of SI engine combustion processes Thermodynamic analysis of SI engine combustion, Flame structure and speed, abnormal combustion. Features of CI engine combustion process, conceptual CI engine combustion models, combustion process characterization. Fuel injection, spray structure, atomization, penetration, drop size distribution, spray evaporation. Ignition delay, factors affecting delay. Mixing controlled combustion, heat release rates, effect of engine design variables, swirl, injection rates. Thermodynamic analysis of CI engine combustion. Supercharging of SI & CI engines and its limitations, methods of supercharging, supercharging arrangements , turbochargers , methods of turbo charging & its limitations.

Air Pollution - Sources and nature of various types of pollutants, Pollutant formation, control, Pollution monitoring instruments and techniques. Modern developments in IC Engines, EGR, MPFI, HCCI, Gasoline Direct Injection. Alternative fuels to reduce emissions: Alcohols, natural gas, biodiesel, hydrogen.

MTS(PE)-25004 Introduction to Modeling and Simulation of Hydrogen Technologies

Examination Scheme: MSE -30, TA – 20 marks , End-Sem Exam - 50

Course Outcomes:

At the end of the course the students will be able to

CO 1 Explain key modeling and simulation philosophies and tools for hydrogen energy systems, with distinctions between 0D–3D and steady-state vs. dynamic models.

CO 2 Apply fundamental principles of electrochemistry and thermodynamics to model hydrogen production and consumption processes, including the calculation of relevant thermodynamic properties.

CO 3 Develop and analyze simulation models for hydrogen production technologies such as water electrolysis, with an ability to implement steady-state and dynamic simulations.

CO 4 Construct equivalent models for hydrogen application technologies (including fuel cells, engines, and turbines) and evaluate their performance using simulation tools.

CO 5 Perform techno-economic assessments of hydrogen systems using levelized cost analysis and critically appraise the economic viability of advanced hydrogen technologies.

1.

Syllabus Contents:

Overview of modelling and simulation approaches

Modelling and simulation philosophy, type of models – 0D-3D, steady-state vs dynamic, physics-based models, data-driven models, hybrid models, availability of 0D/1D simulation environments – MATLAB/Simulink, Python, GT-POWER.

Basic principles in Hydrogen production and consumption processes

Overview of electrochemistry - chemical equilibrium, reaction rates, basic thermodynamics – enthalpy, entropy, Gibbs free energy, calculation of reversible voltages at STP, basic power electronics – rectifiers, inverters, DC/DC and AC/AC converters.

Modeling Hydrogen production technologies – Water Electrolysis

Overview of various Hydrogen generation technologies – biomass gasification, thermolysis (solar, nuclear, with and without catalysts), photocatalysis, methane decomposition, water electrolysis. Overview of water electrolysis techniques for Green Hydrogen production (Alkaline, PEM and solid oxide). PEM electrolyzer cell example - Deep dive into electrical, chemical and mechanical equivalent steady-state models in 0D, steady-state vs dynamic simulation.

Modeling Hydrogen application technologies – Fuel cells

Challenges with Hydrogen storage and transportation design, Overview of various Hydrogen application technologies – Hydrogen internal combustion engine, Hydrogen gas turbine, fuel cells. Overview of power generation techniques using Fuel cells (Alkaline, PEM and solid oxide). PEM fuel cell example - Deep dive into electrical, chemical and mechanical equivalent steady-state models in 0D, steady-state vs dynamic simulation.

Modeling for techno-economic analysis of advanced energy devices

Key performance indicators to assess technology, levelized cost of X analysis e.g. LCOH, making various investment decisions, future trends in modelling and simulations, future trends in Hydrogen technologies

(SET-25001) Research Methodology and Intellectual Property Rights

Course Outcomes:

Student will be able to

1. Understand research problem formulation and approaches of investigation of solutions for research problems
2. Learn ethical practices to be followed in research and apply research methodology in case studies and acquire skills required for presentation of research outcomes
3. Discover how IPR is regarded as a source of national wealth and mark of an economic leadership in context of global market scenario
4. Summarize that it is an incentive for further research work and investment in R & D, leading to creation of new and better products and generation of economic and social benefits

Syllabus Contents:

Unit 1: Fundamentals of Communication

[5 Hrs]

Meaning of research problem, Sources of research problem, Criteria Characteristics of a good research problem, Errors in selecting a research problem, Scope and objectives of research problem.

Approaches of investigation of solutions for research problem, data collection, analysis, interpretation, necessary instrumentations.

Unit 2: Aural-Oral Communication

[5 Hrs]

Effective literature studies approaches, analysis

Use Design of Experiments /Taguchi Method to plan a set of experiments or simulations or build prototype

Analyze your results and draw conclusions or Build Prototype, Test and Redesign

Unit 3: Reading and Writing

[5 Hrs]

Plagiarism, Research ethics

Effective technical writing, how to write report, Paper.

Developing a Research Proposal, Format of research proposal, a presentation and assessment by a review committee

Unit 4 :**[4Hrs]**

Introduction to the concepts Property and Intellectual Property, Nature and Importance of Intellectual Property Rights, Objectives and Importance of understanding Intellectual Property Rights

Unit 5 :**[7Hrs]**

Understanding the types of Intellectual Property Rights: -Patents-Indian Patent Office and its Administration, Administration of Patent System – Patenting under Indian Patent Act , Patent Rights and its Scope, Licensing and transfer of technology, Patent information and database. Provisional and Non Provisional Patent Application and Specification, Plant Patenting, Idea Patenting, Integrated Circuits, Industrial Designs, Trademarks (Registered and unregistered trademarks), Copyrights, Traditional Knowledge, Geographical Indications, Trade Secrets, Case Studies

Unit 6:**[4Hrs]**

New Developments in IPR, Process of Patenting and Development: technological research, innovation, patenting, development, International Scenario: WIPO, TRIPs, Patenting under PCT

References:

1. Aswani Kumar Bansal : Law of Trademarks in India
2. B L Wadehra : Law Relating to Patents, Trademarks, Copyright,
 - a. Designs and Geographical Indications.

7. Manual of Patent Office Practice and Procedure
8. WIPO : WIPO Guide To Using Patent Information
9. Resisting Intellectual Property by Halbert ,Taylor & Francis
10. Industrial Design by Mayall, Mc Graw Hill
11. Product Design by Niebel, Mc Graw Hill

Course Outcomes:

The student should be able to

1. Student will be able to understand the basic concepts and difference between composite materials with conventional materials.
2. Students will be able to understand role of constituent materials in defining the average properties and response of composite materials on macroscopic level.
3. Students will be able to apply knowledge for finding failure envelopes and stress-strain plots of laminates.
4. Students will be able to develop a clear understanding to utilize subject knowledge using computer programs to solve problems at structural level.

Syllabus Contents:

Introduction

Definition and characteristics, Overview of advantage and limitations of composite materials, Significance and objectives of composite materials, Science and technology, current status and future prospectus

Basic Concepts and Characteristics

Structural performance of conventional material, Geometric and physical definition, Material response, Classification of composite materials, Scale of analysis; Micromechanics, Basic lamina properties, Constituent materials and properties, Properties of typical composite materials

Elastic Behavior of Unidirectional Lamina

Stress-strain relations, Relation between mathematical and engineering constants, transformation of stress, strain and elastic parameters

Strength of Unidirectional Lamina

Micromechanics of failure; failure mechanisms, Macromechanical strength parameters, Macro-mechanical failure theories, Applicability of various failure theories

Elastic Behavior of Laminate

Basic assumptions, Strain-displacement relations, Stress-strain relation of layer within a laminate, Force and moment resultant, General load–deformation relations, Analysis of different types of laminates

Hygrothermal Effects

Hygrothermal effects on mechanical behavior, Hygrothermal stress-strain relations, Hygrothermoelastic stress analysis of laminates, Residual stresses, Warpage

Stress and Failure Analysis of Laminates

Types of failures, Stress analysis and safety factors for first ply failure of symmetric laminates, Micromechanics of progressive failure; Progressive and ultimate laminate failure, Design methodology for structural composite materials

OEC-MHP-25034
Finite Element Method

Teaching Scheme

Lectures: 3 hrs/week

Examination Scheme

MSE -30, TA – 20 marks each, End-Sem Exam - 50

Course Outcomes:

At the end of the course:

1. The student will be able to classify a given problem on the basis of its dimensionality as 1-D, 2-D, or 3-D, time-dependence as Static or Dynamic, Linear or Non-linear.
2. The students will be able to develop system level matrix equations from a given mathematical model of a problem following the Galerkin weighted residual method or principle of stationary potential.
3. While demonstrating the process mentioned in 2 above, he will be able to identify the primary and secondary variables of the problem and choose correct nodal degrees of freedom and develop suitable shape functions for an element, implement Gauss-Legendre scheme of numerical integration to evaluate integrals at element level, and assemble the element level equations to get the system level matrix equations. He will also be able to substitute the essential boundary conditions correctly and obtain the solution to system level matrix equations to get the values of the field variable at the global nodes.
4. The student will be able to state three sources of errors in implementing FEM and suggest remedies to minimize the same for a given problem, viz. Modelling errors, Approximation errors, and numerical errors.
5. The student will be able to obtain consistent and lumped mass matrices for axial vibration of bars and transverse vibration of beams and obtain fundamental frequency of natural vibration using the methods mentioned in the curricula.
6. The students will be able use MATLAB for implementation of FEM to obtain elongations at nodes of a bar subjected to traction and concentrated loads and prescribed boundary conditions
7. The students will be able to use commercial software like ANSYS or ABAQUS for implementation of FEM to obtain stress concentration due to a small hole in a rectangular plate subjected to traction on edges and concentrated loads at points on the edges and prescribed boundary conditions.

Syllabus Contents:

Introduction, Classification of problems – Dimensionality, time dependence, Boundary Value problems, Initial value problems, Linear/Non-linear, etc,

Differential equation as the starting point for FEM, steps in finite element method, discretization, types of elements used, Shape functions,

Linear Elements, Local and Global coordinates, Coordinate transformation and Gauss-Legendre scheme of numerical integration, Nodal degrees of freedom,

Finite element formulation, variational, weighted residual and virtual work methods, 1-D and 2-D problems from Structural Mechanics – Bar and Beam problem,

Plane stress and plane strain problems, Axi-symmetric problems – Axi-symmetric forces and geometry, computer implementation, higher order elements, iso-parametric formulation,

Eigen-value problems, Natural axial vibration of bars and transverse vibration of beams, Methods to find eigen-values and eigen-vectors.

(MTS-25007) Computational Fluid Dynamics

Teaching Scheme

Examination Scheme

Lectures: 2hrs/week, Practical:2hr/week Theory: SE -30, TA – 20 marks , End-Sem Exam – 50
Practical : MSE-50 , ESE-50

Course Outcomes:

At the end of the course the students will be able to

1. Understand and modify the governing equations of fluid flow and heat transfer as per

problem statement

2. Discretize the governing equations using finite volume method
3. Apply the boundary conditions in discretized form
4. Numerically solve the conduction, convection, momentum and energy equation
5. Carry out the post processing of the results to determine engineering parameters

Syllabus Contents:

- **Introduction to CFD:** Computational approach to Fluid Dynamics and its comparison with experimental and analytical methods, Basics of PDE: Elliptic, Parabolic and Hyperbolic Equations.
- **Governing Equations:** Review of Navier-Stokes Equation and simplified forms, Solution Methodology: FDM and FVM with special emphasis on FVM, Stability, Convergence and Accuracy.
- **Finite Volume Method:** Domain discretization, types of mesh and quality of mesh, SIMPLE, pressure velocity coupling, Checkerboard pressure field and staggered grid approach
- **Geometry Modeling and Grid Generation:** Practical aspects of computational modeling of flow domains, Grid Generation, Types of mesh and selection criteria, Mesh quality, Key parameters and their importance
- **Methodology of CFDHT:** Objectives and importance of CFDHT, CFDHT for Diffusion Equation, Convection Equation and Convection-Diffusion Equation
- **Solution of N-S Equations for Incompressible Flows:** Semi-Explicit and Semi-Implicit Algorithms for Staggered Grid System and Non Staggered Grid System of N-S Equations for Incompressible Flows

Any four practical / simulation based assignments from the below list for practical component of CFD course:

- 1) Write code Finite volume solution for 1D and 2D Steady state Conduction Heat transfer problem and validate by software
- 2) Write code Finite volume solution for 1D and 2D Unsteady state Conduction Heat transfer problem and validate by software
- 3) Write code Finite volume solution for 1D and 2D Unsteady state Convection Heat transfer problem and validate by software
- 4) Write code Finite volume solution for 2D steady state Incompressible Fluid flow problem and validate by software
- 5) Grid independence study on CFD using different equation and flow equation to check convergence and pressure drop.
- 6) Write code for the Impact of Mesh Type and Quality on CFD Results for Flow Over a body

3. Numerical Methods in Fluid Flow & Heat Transfer by Dr. SuhasPatankar.
4. An Introduction to Computational Fluid Flow (Finite Volume Method), by H.K. Versteeg, W.Malalasekera, Printice Hall
5. Computational Methods for Fluid Dynamics by Ferziger and Peric, Springer Publication.
6. An Introduction to Computational Fluid Mechanics by Chuen-Yen Chow, Wiley Publication.
7. Computational Fluid Flow & Heat Transfer by Murlidhar and Sundarrajan, Narosa Publication.

Course Outcomes:

At the end of the course the students will be able to:

1. select the appropriate heat exchanger
2. estimate fouling rates according to design conditions
3. perform sizing and rating of heat exchangers for complicated designs
4. design, analyze and evaluate heat exchangers and use of commercial software
5. perform optimum design of heat exchangers

Syllabus Contents:

Heat Exchangers – Classification according to transfer process, flow arrangement, number of fluids, surface compactness, and construction features. Tubular heat exchanger, plate type heat exchangers, extended surface heat exchangers, heat pipe, Regenerators.

Heat exchanger design methodology, assumption for heat transfer analysis, problem formulation, ϵ -NTU method, P-NTU method, Mean temperature difference method.

Fouling of heat exchanger, effects of fouling, categories of fouling, fundamental processes of fouling, determination of fouling resistance and consequences of fouling on performance of heat exchangers.

Double Pipe Heat Exchangers: Thermal and Hydraulic design of inner tube, Thermal and hydraulic analysis of Annulus, Pressure drop analysis

Compact Heat Exchangers: Thermal and Hydraulic design of compact heat exchanger

Shell and Tube heat exchangers – Tinker's, Kern's, and Bell Delaware's methods, for thermal and hydraulic design of Shell and Tube heat exchanger

Mechanical Design of Heat Exchangers – design standards and codes, key terms in heat exchanger design, and thickness calculation for major components such as tube sheet, shell, tubes etc.

Optimum design of Heat Exchanger- Heat transfer equipment cost, relative cost, optimum design and optimization procedure

Any four practical / simulation based assignments from the below list for Energy System Lab Practice course component:

1. Trial on concentric tube heat exchanger for its performance evaluation
2. Trial on shell and tube heat exchanger for its performance evaluation by using virtual lab facility
3. Optimization of heat exchanger design by using suitable software or writing code
4. Simulation of performance of compact heat exchanger by using suitable software/code
5. Case study of heat exchanger used in industrial applications.

(MTS-25009) Gas Turbines and Jet Propulsion

Teaching Scheme : Lectures: 3hrs/week

Examination Scheme: MSE-30, TA-20, ESE-50

Course Outcomes:

At the end of the course, students will demonstrate the ability to:

1. Understand compressible flow through variable area ducts, concept of shock waves, and flow with friction and heat addition.
2. Understand the thermodynamic cycle for Gas Turbine – the principle of operation of compressors, and turbines.
3. Analyze the design concepts for components of Axial, Radial flow Multistage Gas Turbines, Axial flow and Centrifugal compressors for optimum performance including Surging and stalling .
4. Interpret the basic principle of Jet Propulsion –for air-breathing Aircraft Engines and have clear understanding about the performance characteristics of Jet Propulsion.

Syllabus Contents:

- Compressible Flow: One-dimensional flow, speed of sound, variable cross-section flow, converging diverging nozzle, flow with friction and heat transfer, normal and oblique shock waves. Fundamentals of turbo machines: ideal and actual cycles for shaft power and propulsion. Compressors: axial flow and centrifugal compressors, principle of operation, work done, elementary theory, performance, compressibility effects, surge and stall. Combustion Systems: types, requirements, combustion chamber performance, emissions. Axial and radial flow turbines: elementary theory, vortex theory, performance characteristics, blade cooling, design of gas turbines, off design performance, gas turbine blade materials. Thermodynamics of propulsion system, engine performance parameters. Air breathing and non-air breathing engines, aircraft gas turbine engine, cycle analysis of ideal and real engines. Turbojet, turboprop, turbofan engines, ramjet and pulsejet engines.

Any four practical / simulation based assignments from the below list for Energy System Lab Practice course component:

1. Determination of properties of fluid across normal/oblique shock wave by using suitable software or computer code
2. Plotting of pressure-velocity profile in convergent divergent nozzle by using suitable software or computer code
3. Write a computer program/code for modeling the performance of gas turbine cycle
4. Plotting of characteristics curves of centrifugal/axial flow compressors by using suitable software or computer code
5. Case study of any gas turbine power plant
6. Estimation of thrust on jet for given problem statement
7. Field visit to thrust measurement facility

(MTS-25010) Energy System Lab Practice

Teaching scheme:

Practical: 4 hrs/week,

Examination scheme:

ISE – 50 ,ESE-50

Course Outcomes:

At the end of the course, students will be able to:

1. Apply the fundamental understanding of gas dynamics to various devices like nozzles
2. Evaluate the performance of gas turbine and jet propulsion cycles
3. Evaluate the performance of different heat exchangers
4. Design the heat exchanger with given conditions

Syllabus Contents:

- Students are expected to carry out at least 8 practical assignments (Minimum four from each of the courses on gas turbines and jet propulsion and heat exchanger design as detailed in the syllabi of respective courses.

Any four practical / simulation based assignments from the below list for Energy System Lab Practice course component:

8.
 1. Determination of properties of fluid across normal/oblique shock wave by using suitable software or computer code
 2. Plotting of pressure-velocity profile in convergent divergent nozzle by using suitable software or computer code
 3. Write a computer program/code for modeling the performance of gas turbine cycle
 4. Plotting of characteristics curves of centrifugal/axial flow compressors by using suitable software or computer code
 5. Case study of any gas turbine power plant
 6. Estimation of thrust on jet for given problem statement
 7. Field visit to thrust measurement facility
 8. Trial on concentric tube heat exchanger for its performance evaluation
 9. Trial on shell and tube heat exchanger for its performance evaluation by using virtual lab facility
 10. Optimization of heat exchanger design by using suitable software or writing code
 11. Simulation of performance of compact heat exchanger by using suitable software/code
 12. Case study of heat exchanger used in industrial applications.

Program Specific Elective Course –II

MTS(PE)-25005

Solar and Wind System Design

Teaching Scheme:

Lectures: 3 hrs/week

Examination Scheme:

MSE-30, TA-20, ESE-50

Course Outcomes:

At the end of the course the students will be able to

1. Demonstrate significance of analysis of solar and wind sources and design technologies of their Utilization
2. Confidently estimate the potential of solar and wind resources through numerical Assignments
3. Understand economics of Solar and Wind power plants
4. Expose themselves to conceptualize and design renewable energy appliances and equipment
5. Enable them to independently analyze, implement and asses the real life systems
6. Develop a research insight about solar and wind energy technologies so as to motivate all concerned for enhanced deployment of renewable energy option

Syllabus Contents:

Introduction: Solar radiation fundamentals, review of solar thermal applications and devices, Indian Standards for FPC, Characterization of Flat plate collectors, Design and Performance estimation of solar water and air heating systems, modern design and simulation methods, intelligence economic analysis of solar systems

Medium and high temperature applications of Solar Thermal Energy – Concentrating collectors, classification, types and suitability, tracking, Performance evaluation point of focusing, line focusing collectors, Industrial Process heating systems, Solar thermal power generation-technologies, Thermodynamic cycles, Storage issues and challenges in the commercialization.

Solar Photovoltaic Conversion- Review of Basics of Photovoltaic Technology, Fill Factor, Impact of Temperature and Shading on the performance of a PV modules, shading correction, MPPT, NOCT, Design of Standalone and grid connected Solar Photovoltaic arrays and systems, BOS

Wind power systems

History and types of wind machines, Terminology, Dimensional analysis, Principles of Aerodynamics of wind turbine blade, Maximum rotor efficiency (Betz Limit), Power output from practical wind turbine generators, Concept of Load matching.

Wind Resource analysis

Average power in wind, Wind speed statistics, Wind speed distribution, Wind shear, Wind measurement instrumentation, Wind data analysis, tabulation, Wind resource estimation.

Wind turbine Generators, Control and hybrid systems

Generators and control systems, On-grid and off grid wind power plants, sizing of wind based off grid systems, wind-PV hybrid, wind-diesel hybrid

MTS(PE)-25006 Renewable Energy Systems**Teaching Scheme**

Lectures: 3 hrs/week

Examination Scheme

MSE-30 TA-20, ESE-50

Course Outcomes:

At the end of the course the students will be able to

1. Analyze the performance of solar energy conversion systems.
2. Performance analysis of various wind energy conversion systems.
3. Compare various bio-energy conversion methods
4. Explore various ocean energy resources such as tidal, wave and ocean thermal energy and geothermal energy systems.

Syllabus :

Introduction: Energy demand growth and supply: Historical Perspectives, Fossil fuels, Consumption and Reserve; Environmental Impacts of Burning of Fossil fuels. Sustainable development and role of renewable energy sources. Solar Energy: The Sun as energy source and its movement in the sky. Solar energy received on the earth; Primary and Secondary Solar energy and Utilization of Solar Energy. Solar concentrators and tracking; Dish and Parabolic trough concentrating generating systems, Central tower solar thermal power plants; Solar ponds. Photovoltaic cells. Wind Energy: Types of turbines, Coefficient of Power, Betz limit, Wind electric generators, Power curve; wind characteristics and site selection; Potential of wind electricity generation in India and its current growth rate. Biomass Energy: Biomass: Sources and Characteristics; Wet biogas plants; Biomass gasifiers: Classification and Operating characteristics; Updraft and Downdraft gasifiers; Gasifier based electricity generating systems. Ocean Energy: Tidal power plants: single basin and double basis plants, Variation in generation level; Ocean Thermal Electricity Conversion (OTEC); Power generation from Waves: Shoreline and Floating wave systems. Geothermal Energy: Conversion technologies- Steam and Binary systems; Geothermal power plants.

MTS(PE)-25007 Cooling of Electronic System**Teaching Scheme**

Lectures: 3 hrs/week

Examination Scheme

T1, T2 – 20 marks each, End-Sem Exam - 60

Course Outcomes:

At the end of the course the students will be able to

1. Understand the heat transfer mechanisms of electronic cooling systems. and assess their capability and applicability
2. Describe different cooling techniques and its applications in various domains
3. Analyse new cooling methods in the present scenario and use of commercial tools

Syllabus :

Introduction, objectives of thermal control, heat sources, heat transmission, steady and unsteady heat transfer. Electronic equipment for airplanes, missiles, satellites, spacecraft, ships, submarines, personal computers, microcomputers and microprocessors. Cooling techniques: i) air cooling-natural cooling ii) air cooling-forced convection iii) liquid cooling. Thermal contact conductance, fundamentals of heat transfer across an interface, real contact area, applications to microelectronics, enhancement of contact conductance. Extended surface arrays for air cooled systems, parameterizations, the fin input admittance, the limitations of the fin efficiency, Introduction to impinging jet theory, description of the principal flow regimes, single nozzle and multi-nozzle test rig, Taxonomy of liquid jet impingement conditions. Unconfined: free surface and submerged jets, semi confined, submerged jets. Heat transfer for unconfined free-surface and submerged jets i) circular ii) planar jets. Multiple impinging jets. Synthetic jets design and measurement approaches, enhancing heat transfer with synthetic jets (free and forced convection). Introduction to heat pipe, working principle, thermal performance, design, thermal resistance considerations, types of heat pipes, cylindrical, flat, micro and oscillating heat pipes.

Program Specific Elective Course–III**MTS(PE)-25008 Micro-fluidics****Teaching Scheme**

Lectures: 3 hrs/week

Examination Scheme

T1, T2 – 20 marks each, End-Sem Exam - 60

Course Outcomes:

At the end of the course students will be able to:

1. Understand the fundamentals of the physics of flows at micro-level in terms of Knudsen number
2. Mathematically model the micro scale flow including boundary conditions
3. Solve the flow problems in case of capillary flow
4. Explain and apply fundamentals of electro-kinetics to the flow problems

Syllabus Contents:**Introduction:**

Origin, Definition, Benefits, Challenges, Commercial activities, Physics of miniaturization, Scaling laws.

Micro-scale fluid mechanics:

Intermolecular forces, States of matter, Continuum assumption, Governing equations, Constitutive relations. Gas and liquid flows, Boundary conditions, Slip theory, Transition to turbulence, Low Re flows, Entrance effects. Exact solutions, Couette flow, Poiseuille flow, Stokes drag on a sphere, Time-dependent flows, Two-phase flows, Thermal transfer in microchannels.

Capillary flows:

Surface tension and interfacial energy, Young-Laplace equation, Contact angle, Capillary length and capillary rise, Interfacial boundary conditions, Marangoni effect.

Electrokinetics:

Electrohydrodynamics fundamentals. Electro-osmosis, Debye layer, Thin ED limit, Ideal electroosmotic flow, Ideal EOF with back pressure, Cascade electroosmotic micropump, EOF of power-law fluids. Electrophoresis of particles, Electrophoretic mobility, Electrophoretic velocity dependence on particle size. Dielectrophoresis, Induced polarization and DEP, Point dipole in a dielectric fluid, DEP force on a dielectric sphere, DEP particle trapping, AC DEP force on a dielectric sphere. Electro-capillary effects, Continuous electro-wetting, Direct electro-wetting, Electro-wetting on dielectric.

Microfluidics components:

Micropumps, Check-valve pumps, Valve-less pumps, Peristaltic pumps, Rotary pumps, Centrifugal pumps, Ultrasonic pump, EHD pump, MHD pumps. Microvalves, Pneumatic valves, Thermopneumatic valves, Thermomechanical valves, Piezoelectric valves, Electrostatic valves, Electromagnetic valves, Capillary force valves. Microflow sensors, Differential pressure flow sensors, Drag force flow sensors, Lift force flow sensors, Coriolis flow sensors, Thermal flow sensors. Micromixers, Physics of mixing, Pe-Re diagram of micromixers, Parallel lamination, Sequential lamination, Taylor-Aris dispersion. Droplet generators, Kinetics of a droplet, Dynamics of a droplet, In-channel dispensers, T-junction and Cross-junction, Droplet formation, breakup and transport. Microparticle separator, principles of separation and sorting of microparticles, design and applications. Microreactors, Design considerations, Liquid-phase reactors, PCR, Design consideration for PCR reactors.

Few applications of microfluidics:

Drug delivery, Diagnostics, Bio-sensing.

MTS(PE)-25009 Air conditioning system Design**Teaching Scheme**

Lectures: 3 hrs/week

Examination Scheme

MSE-30, TA-20, ESE-50

Course Outcomes:

At the end of the course students will be able to:

1. Understand construction and design features Air-conditioning system.
2. Apply psychrometry for the practical applications.
3. Design Air conditioning systems.
4. Design seasonal energy efficient systems
5. Design Air conditioning ducts.

Syllabus Contents:

- Air conditioning systems,
- Various air-conditioning processes,
- Enthalpy deviation curve, Psychrometry, SHF, dehumidified air quantity, human comfort, indoor air quality,
- Design conditions and load calculations, air distribution, pressure drop, duct design, fans & blowers,
- Cooling load estimation for residential and industry applications, designing the AC systems, selection of components, design of ducts.
- Performance & selection, noise control.

MTS(PE)-25010 Energy and Environment

Course Outcomes:

At the end of the course students will be able to:

1. Understand the types of energy resources and its utilization, Energy scenario, Energy conservation and management.
2. Understand the sources of air pollution, its measurement and control
3. Understand the sources of water, water pollution, its measurement and control and water treatment

Syllabus Contents:

Basics of energy: Types of energy and its utilization; Energy characteristics; Energy scenario - India energy scenario- Energy crisis. Energy conservation. Environment studies: Water cycle - Oxygen cycle - Carbon cycle - Nitrogen cycle - Phosphorous cycle; Bio-diversity. Environmental aspects of energy utilization. Hazards of environmental Pollution. Air Pollution: air pollutants, sources of emission; Air quality standards; Physical and chemical characteristics - Meteorological aspects; Temperature lapse rate and stability. Dispersal of air pollutant - Air pollution dispersion models: sampling and measurement, Analysis of air pollutants. Air Pollution Control methods: Particulate emission control; Gaseous emission control. Water pollution: Sources and hazards, water quality standards; Waste water sampling and analysis; Waste water treatment: Primary treatment - Secondary treatment - Advanced treatment. Feed water treatment. Pollution prevention and control acts; Methodology of Environmental impact assessment, Air and water quality impacts by project type.

5. James A. Fay and Dan S. Golomb, "Energy and the Environment", Oxford University Press, 2002.

SET-25002 Effective Technical Communication

Course Outcomes:

Student will be able to

1. Produce effective dialogue for business related situations
2. Use listening, speaking, reading and writing skills for communication purposes and attempt tasks by using functional grammar and vocabulary effectively
3. Analyze critically different concepts / principles of communication skills
4. Demonstrate productive skills and have a knack for structured conversations
5. Appreciate, analyze, evaluate business reports and research papers

Syllabus Contents:

Unit 1: Fundamentals of Communication

[4 Hrs]

7 Cs of communication, common errors in English, enriching vocabulary, styles and registers

Unit 2: Aural-Oral Communication

[4 Hrs]

The art of listening, stress and intonation, group discussion, oral presentation skills

Unit 3: Reading and Writing

[4 Hrs]

Types of reading, effective writing, business correspondence, interpretation of technical reports and research Papers

5. Thomas Huckin, Leslie Olsen "Technical writing and Professional Communications for Non-native speakers of English", McGraw Hill.

LLC -Liberal Learning Course

(Basket of this courses is offered at University Level)

SLC-MTS-25001 Massive Open Online Course –I

Examination Scheme

End semester assessment: 100

➤ MOOC Courses:

- ✓ The MOOC Course must be from NPTEL of minimum 12 weeks duration.
- ✓ Generally the selected course should be in line with specializations or project needs.

SLC-MTS-25002 Massive Open Online Course –II

Examination Scheme

End semester assessment: 100

➤ **MOOC Courses:**

- ✓ The MOOC Course must be from NPTEL of minimum 12 weeks duration.
- ✓ Generally the selected course should be in line with specializations or project needs.

ELC -MTS-25001 Internship

Students should undergo internship in third semester

Examination Scheme

End semester assessment: 100

ELC -MTS-25002 Dissertation Phase-I

Teaching Scheme

Practical: 22 hr/week

SelfStudy:12 hr/week

Examination Scheme

In semester assessment: 70

End semester assessment 30

Course Outcomes:

At the end of the course the students will be able to

1. Students will be exposed to self learning various topics.
2. Carry out literature survey from books, national/international refereed journals and contact resource persons for the selected topic of research.
3. Learn to write technical reports.
4. Develop oral and written communication skills to present and defend their work in front of technically qualified audience. .

Guidelines:

- The Project Work will start in semester III and should preferably be a problem with research potential and should involve scientific research, design, generation/collection and analysis of data, determining solution and must preferably bring out the individual contribution. Seminar should be based on the area in which the candidate has undertaken the dissertation work as per the common instructions for all branches of M. Tech. The

examination shall consist of the preparation of report consisting of a detailed problem statement and a literature review. The preliminary results (if available) of the problem may also be discussed in the report. The work has to be presented in front of the examiners panel set by Head and PG coordinator. The candidate has to be in regular contact with his guide and the topic of dissertation must be mutually decided by the guide and student.

ELC -MTS-25003

Teaching Scheme

Practicals:22 hr/week

Self study:12 hr/week

Dissertation Phase- II

Examination Scheme

In semester assessment: 70

End semester assessment 30

Course Outcomes:

At the end of the course students will be able to

1. Use different experimental techniques.
2. Use different software/ computational/analytical tools.
3. Design and develop an experimental set up/ equipment/test rig.
4. Conduct tests on existing set ups/equipments and draw logical conclusions from the results after analyzing them.
5. Work in a research environment or in an industrial environment.
6. make themselves conversant with technical report writing.
7. Present and convince their topic of study to the engineering community.

Guidelines:

- It is a continuation of dissertation work started in semester III. He/she has to submit the report in the prescribed format and also present a seminar. The dissertation should be presented in standard format as provided by the department. The candidate has to prepare a detailed project report consisting of introduction of the problem, problem statement, literature review, objectives of the work, methodology (experimental set up or numerical details as the case may be) of solution and results and discussion. The report must bring out the conclusions of the work and future scope for the study. . The work has to be presented in front of the examiners panel consisting of an approved external examiner, an internal examiner and a guide, co-guide etc. as decided by the Head and PG coordinator. The candidate has to be in regular contact with his guide throughout the semester.
